## Rectangular Microstrip Antenna (RMSA)

Side View

## Microwave Integrated Circuits (MIC) vs MSA

| Parameters | MIC | MSA |
| :---: | :---: | :---: |
| Dielectric <br> Constant $\left(\varepsilon_{\mathrm{r}}\right)$ | Large | Small |
| Thickness (h) | Small | Large |
| Width (W) | Generally Small <br> (impedance dependent) | Generally Large |
| Radiation | Minimum (small fringing <br> fields) | Maximum (large <br> fringing fields) |
| Examples | Filters, power dividers, <br> couplers, amplifiers, etc. | Antennas |

## Substrates for MSA

| Substrate | Dielectric <br> Constant $\left(\varepsilon_{\mathrm{r}}\right)$ | Loss tangent <br> $(\tan \delta)$ | Cost |
| :---: | :---: | :---: | :---: |
| Alumina | 9.8 | 0.001 | Very <br> High |
| Glass Epoxy | 4.4 | 0.02 | Low |
| Duroid / <br> Arlon | 2.2 | 0.0009 | Very <br> High |
| Foam | 1.05 | 0.0001 | Low/ <br> Medium |
| Air | 1 | 0 | NA |

## Advantages

> Light weight, low volume, low profile, planar configuration, which can be made conformal
$>$ Low fabrication cost and ease of mass production
$\Rightarrow$ Linear and circular polarizations are possible
$>$ Dual frequency antennas can be easily realized
$>$ Feed lines and matching network can be easily integrated with antenna structure

## Disadvantages

$>$ Narrow bandwidth (1 to 5\%)
> Low power handling capacity
$>$ Practical limitation on Gain (around 30 dB )
$>$ Poor isolation between the feed and radiating elements
> Excitation of surface waves
$>$ Tolerance problem requires good quality substrate, which are expensive
$>$ Polarization purity is difficult to achieve
$>$ Size is large at lower frequency

## Applications

> Pagers and mobile phones
$>$ Doppler and other radars
> Satellite communication
$>$ Radio altimeter
$>$ Command guidance and telemetry in missiles
$>$ Feed elements in complex antennas
$>$ Satellite navigation receiver
> Biomedical radiator

# Various Microstrip Antenna Shapes

Square ring

## MSA Feeding Techniques

## Coaxial Feed

Microstrip Line Feed

## Microstrip Feed (contd.)

RMSA with microstrip line feed along its (a) nonradiating edge, (b) radiating edge with inset feed, and (c) radiating edge with quarter-wave transformer.

## Electromagnetically Coupled Feed

## Aperture Coupled Feed

## RMSA: Resonance Frequency

$L_{e}=L+2 \Delta L$
$W_{e}=W+2 \Delta W$
$\Delta L \simeq \frac{h}{\sqrt{\epsilon_{e}}}$

$$
f_{0}=\frac{c}{2 \sqrt{\epsilon_{e}}}\left[\left(\frac{m}{L}\right)^{2}+\left(\frac{n}{W}\right)^{2}\right]^{1 / 2}
$$

where m and n are orthogonal modes of excitation.
Fundamental mode is $\mathrm{TM}_{10}$ mode, where $\mathrm{m}=1$ and $\mathrm{n}=0$.

## RMSA - Characterization

Fundamental TM $_{10}$ mode of RMSA: (a) E-field distribution, (b) ( $\quad$ _ ) voltage and ( $\cdots$ ) current variation, (c) two radiating slots, and (d) equivalent transmission line model.

## RMSA: Design Equations

$$
\epsilon_{e}=\frac{\left(\epsilon_{r}+1\right)}{2}+\frac{\left(\epsilon_{r}-1\right)}{2}\left[1+\frac{10 h}{W}\right]^{-1 / 2}
$$

$$
W=\frac{c}{\square} \text { Smaller or larger } W \text { can be taken than }
$$

$$
2 f_{0} \sqrt{\frac{\left(\epsilon_{r}+1\right)}{2}} \quad \begin{array}{r}
\text { the } \mathrm{W} \text { obtained from this express } \\
\mathrm{BW} \alpha \mathrm{~W} \text { and Gain } \alpha \mathrm{W}
\end{array}
$$

$$
L_{e}=L+2 \Delta L=\frac{\lambda_{0}}{2 \sqrt{\epsilon_{e}}}=\frac{c}{2 f_{0} \sqrt{\epsilon_{e}}}
$$

Choose feed-point $x$ between $L / 6$ to $L / 4$.

## RMSA: Design Example

Design a RMSA for Wi-Fi application (2.400 to 2.483 GHz )
Chose Substrate: $\varepsilon_{\mathrm{r}}=2.32, \mathrm{~h}=0.16 \mathrm{~cm}$ and $\tan \delta=0.001$

$$
\left.\begin{array}{l}
W=\frac{c}{W f_{0} \sqrt{\frac{\left(\epsilon_{r}+1\right)}{2}}}=3 \times 10^{10} /\left(2 \times 2.4415 \times 10^{9} \times \sqrt{ } 1.66\right) \\
=4.77 \mathrm{~cm} . \mathrm{W}=4.7 \mathrm{~cm} \text { is taken }
\end{array}\right] \begin{aligned}
& \epsilon_{e}=\frac{\left(\epsilon_{r}+1\right)}{2}+\frac{\left(\epsilon_{r}-1\right)}{2}\left[1+\frac{10 h}{W}\right]^{-1 / 2}=2.23 \\
& \mathrm{~L}_{\mathrm{e}}=\frac{c}{2 f_{0} \sqrt{\epsilon_{e}}}=3.11 \mathrm{~cm}
\end{aligned} \quad \begin{aligned}
& \mathrm{L}=3 \times 10^{10} /\left(2 \times 2.4415 \times 10^{9} \times \sqrt{ } 2.23\right) \mathrm{cm} \\
& \mathrm{~L}=\mathrm{L}_{\mathrm{e}}-2 \Delta \mathrm{~L}=4.11-2 \times 0.16 / \sqrt{ } 2.23=3.9 \mathrm{~cm}
\end{aligned}
$$

## RMSA: Design Example - Simulation using IE3D

$$
\begin{aligned}
& \mathbf{L}=\mathbf{3 . 9} \mathbf{~ c m}, \mathbf{W}=\mathbf{4 . 7} \mathbf{~ c m}, \mathbf{x}=\mathbf{0 . 7} \mathbf{~ c m} \\
& \varepsilon_{\mathrm{r}}=2.32, \mathrm{~h}=0.16 \mathrm{~cm} \text { and } \tan \delta=0.001
\end{aligned}
$$

$\mathrm{Z}_{\text {in }}=54 \Omega$ at $\mathrm{f}=2.414 \mathrm{GHz}$

BW for $|S 11| \leq-10 \mathrm{~dB}$ is from 2.395 to $2.435 \mathrm{GHz}=40 \mathrm{MHz}$

Designed $\mathrm{f}=2.4415$ and Simulated $\mathrm{f}=2.414 \mathrm{GHz}$ $\%$ error $=1.1 \%$. Also, BW is small. SOLUTION: Increase $h$ and reduce $L$

## Effect of Various Parameters on Performance of RMSA

Substrate parameters: $\varepsilon_{r}=2.55, h=0.159 \mathrm{~cm}$, and tan $\delta=0.001$ Probe diameter $=0.12 \mathrm{~cm}$ for SMA connector .

RMSA is analyzed using commercially available IE3D software.

## Effect of Feed Point Location ( $x$ )

(a)

(b)
(a) Input impedance and (b) VSWR plots of the RMSA for three different values of $x,(---) 0.55,(---) 0.60$, and ( - ) 0.65 cm , and (c) its radiation pattern at 2.975 GHz for $x=0.65 \mathrm{~cm}$; (—) E-plane copolar and cross-polar and ( - - ) H-plane copolar. For Infinite Ground Plane

With increase in $x$, input impedance plot shifts right towards higher impedance values.

## Effect of Width (W)

(b)
(a) Input impedance and (b) VSWR plots of the RMSA for four different W: $(\cdots) 2,(-) 3,(---) 4,(---), 5 \mathrm{~cm}$.
With increase in $W$, aperture area, $\varepsilon_{e}$ and fringing fields increase, hence frequency decreases and input impedance plot shifts towards lower impedance values. BW $\alpha W$ and Gain $\alpha W$

## Effect of Thickness ( $h$ )

(a)

(b)
(a) Input impedance and (b) VSWR plots of the RMSA for two different values of $h:(---) 0.159$ and (-) 0.318 cm .

As $h$ increases, fringing fields and probe inductance increase, frequency decreases and input impedance plot shifts upward.

However, $\quad \frac{h}{\lambda_{0}} \leq \frac{0.3}{2 \pi \sqrt{\epsilon_{r}}}$ to reduce surface waves

## Effect of Probe Diameter

(b)
(a) Input impedance and (b) VSWR plots of the RMSA for two different connectors: (——) SMA and (---) N-type.

As probe diameter decreases, its inductance increases, so resonance frequency decreases and input impedance locus moves upward to the inductive region.

## Effect of Loss Tangent (tan $\delta$ )

(a)

(b)
(a) Input impedance and (b) VSWR plots of the RMSA for different values of $\tan \delta:(-) 0.001,(---) 0.01$, and $(---) 0.02$.

With increase in $\tan \delta$, dielectric losses increase, so input impedance locus moves left towards lower impedance value. BW increases but efficiency and gain decrease.

## Effect of Dielectric Constant $\left(\varepsilon_{r}\right)$

Effect of $\epsilon_{I}$ on the Performance of RMSA ( $h=0.159 \mathrm{~cm}$ and $\tan \delta=0.001$ )

|  | $\boldsymbol{L}$ |  |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\boldsymbol{\epsilon}$ | $\boldsymbol{c m})$ | $\boldsymbol{W}$ |
| $(\mathbf{c m})$ |  |  |

With decrease in $\varepsilon_{r}$, both $L$ and $W$ increase, which increases fringing fields and aperture area, hence both BW and Gain increase.

## RMSA - Pattern for Different $\varepsilon_{r}\left(\mathrm{TM}_{10}\right.$ mode $)$

With increase in $\varepsilon_{r}$, size of the antenna decreases for same resonance frequency.

Hence, gain decreases and HPBW increases.

## RMSA - Pattern for Different $\varepsilon_{r}\left(\mathrm{TM}_{30}\right.$ mode $)$

For $\mathrm{TM}_{30}$ mode,

$$
\mathrm{L}_{\mathrm{e}}=3 \lambda_{0} /\left(2 \sqrt{ } \varepsilon_{e}\right)
$$

For $\varepsilon_{r}=2.32, \mathrm{~L}_{\mathrm{e}} \simeq \lambda_{0}$

So, two radiating slots will be at a distance of
$\lambda_{0}$ yielding grating lobe in E-plane.

## RMSA - Dual Polarization ( $\mathrm{TM}_{10}$ and $\mathrm{TM}_{01}$ modes)

$L=10.1 \mathrm{~cm}$ and $W=7.9 \mathrm{~cm}$
Orthogonal Feeds at:

$$
x=3.8 \mathrm{~cm} \text { and } y=2.9 \mathrm{~cm}
$$

Measured resonance frequencies are 712 MHz and 913 MHz for two orthogonal modes

Substrate Parameters:

$$
\varepsilon_{r}=4.3, h=0.16 \mathrm{~cm}, \tan \delta=0.02
$$

## Effect of Finite Ground Plane

(a)

(b)

(c)
(a) Input impedance and (b) VSWR plots of the RMSA for ( - ) ) finite and ( -- ) infinite ground planes, and (c) its radiation pattern on the finite ground plane: ( $\quad$ —) E-plane copolar and cross-polar and (---) H-plane copolar.

Finite Ground Plane Size is taken as $L_{g}=L+6 h+6 h$ and $W_{g}=W+6 h+6 h$

## MSA - BW Variation with $h$ and $f$

Substrate thickness $h / \lambda_{0}$ (a)

Frequency $(\mathrm{GHz})$
(b)
(a) Variation of percentage BW and efficiency of a square MSA versus $h / \lambda_{0}$. $(-) \epsilon_{r}=2.2,(\cdots) \epsilon_{r}=10$ and (b) variation of percentage BW with frequency for three values of $h$ and $\epsilon_{r}=2.32$ : $(-) 0.318,(\cdots) 0.159$, (---) 0.079 cm .

## Square MSA in Air - VSWR Plot

Square MSA on a finite ground plane.

Low cost - Metallic plate suspended in air $\frac{\text { 宩 }}{3}$ and fed by a co-axial feed.

BW for VSWR $\leq 2$ is 95 MHz at 1.8 GHz (\% BW 工 5\%)

## Square MSA in Air - Radiation Pattern

- E-theta, phi= 0. (deg)
-a- E-phi, phi=0. (deg)
E-theta, phi= 90 . (deg)
$\rightarrow$ E-phi, phi= 90. (deg)

# Radiation Pattern at 1.8 GHz 

$\mathrm{F} / \mathrm{B}=15 \mathrm{~dB}$
Cross Polar $\leq 20 \mathrm{~dB}$

## MSA - Suspended Configurations

$$
\epsilon_{\mathrm{eq}}=\frac{\epsilon_{r}(h+\Delta)}{\epsilon_{r} \Delta+h}
$$

Comparison of Suspended Configurations of Square MSA

$$
(L=14 \mathrm{~cm}, \Delta=2 \mathrm{~cm}, h=0.159 \mathrm{~cm}, x=6.5 \mathrm{~cm})
$$

| Configuration | Frequency Range for <br> VSWR $\leq \mathbf{2}(\mathbf{M H z})$ | BW <br> $(\mathbf{M H z})$ | Gain <br> $(\mathbf{d B})$ |
| :--- | :--- | :--- | :--- |
| Suspended with $\epsilon_{r}=1$ | 935 to 1,019 | 84 | 9.5 |
| Suspended with $\epsilon_{r}=2.3$ | 889 to 970 | 81 | 9.3 |
| Suspended with $\epsilon_{r}=4.3$ | 858 to 934 | 76 | 9.2 |
| Inverted with $\epsilon_{r}=2.3$ | 909 to 988 | 79 | 9.5 |
| Inverted with $\epsilon_{r}=4.3$ | 880 to 955 | 75 | 9.4 |

## CMSA: Resonance Frequency

where $K_{n m}$ is the mth root of the derivative of the Bessel function of order $n$

|  |  |
| :--- | :--- |
| Mode | $\boldsymbol{K}_{\text {nm }}$ |
| $\mathrm{TM}_{11}$ | 1.84118 |
| $\mathrm{TM}_{21}$ | 3.05424 |
| $\mathrm{TM}_{02}$ | 3.83171 |
| $\mathrm{TM}_{12}$ | 5.33140 |

For Fundamental $T M_{11}$ Mode: $f_{0} \simeq 8.791 /\left[\left(a+h / \sqrt{\varepsilon_{r}}\right) \sqrt{\varepsilon_{e}}\right] \mathrm{GHz}$ where $a$ and $h$ are in cm and $\varepsilon_{e} \leq \varepsilon_{r}$

Design Equation:
$a \simeq 8.791 /\left(f_{0} \sqrt{ } \varepsilon_{e}\right)-h / \sqrt{\varepsilon_{r}}$
Choose feed-point $x$ between $0.3 a$ to $0.5 a$

## CMSA: Simulation using IE3D

$$
\begin{aligned}
& a=3 \mathrm{~cm}, h=0.318 \mathrm{~cm}, \varepsilon_{r}=2.55, \\
& \text { tan } \delta=0.001 \text {. Take } x=0.3 a=0.9 \mathrm{~cm} \\
& \text { For Fundamental } T M_{11} \text { Mode: } \\
& f_{0} \simeq 8.791 /[(3+0.318 / \sqrt{ } 2.55) \sqrt{ } 2.45] \\
& \quad=1.756 \mathrm{GHz}
\end{aligned}
$$

Calculated $f_{0}=1.756$, Simulated $f_{0}=1.750 \mathrm{GHz}$, $\%$ error $=0.3 \%$. Simulated BW $=1.730$ to $1.768 \mathrm{GHz}=38 \mathrm{MHz}(\simeq 2 \%)$

## CMSA: Radiation Pattern

$$
E_{\theta}=\left[J_{n+1}\left(k_{0} a \sin \theta\right)-J_{n-1}\left(k_{0} a \sin \theta\right)\right] \cos n \phi
$$

$E_{\phi}=\left[J_{n+1}\left(k_{0} a \sin \theta\right)+J_{n-1}\left(k_{0} a \sin \theta\right)\right] \cos \theta \sin n \phi$ where $J_{n+1}$ and $J_{n-1}$ are the Bessel functions of order $n+1$ and $n-1$, respectively

Gain $=6.5 \mathrm{~dB}$
$\mathrm{HPBW}_{\mathrm{E}}=102^{0}$
$\mathrm{HPBW}_{\mathrm{H}}=81^{0}$
X-pol < 27 dB
Current Distribution and Radiation Pattern at 1.75 GHz

## CMSA: Higher Order TM $_{21}$ Mode

$$
\begin{aligned}
& a=3 \mathrm{~cm}, h=0.318 \mathrm{~cm}, \varepsilon_{r}=2.55 \\
& \tan \delta=0.001, x=1.6 \mathrm{~cm}
\end{aligned}
$$

For $T M_{21}$ Mode:
$f_{0} \simeq 3.05424 \times 30 /[2 \pi(3+0.318 /$
$\sqrt{ } 2.55) \sqrt{ } 2.45]=2.912 \mathrm{GHz}$
Simulated $f_{0}=2.94 \mathrm{GHz}$

Radiation Pattern at 2.94 GHz

## CMSA: Higher Order $T M_{02}$ Mode

$$
\begin{aligned}
& a=3 \mathrm{~cm}, h=0.318 \mathrm{~cm}, \varepsilon_{r}=2.55, \\
& \tan \delta=0.001, x=0.9 \mathrm{~cm}
\end{aligned}
$$

For $T M_{02}$ Mode:
$f_{0} \simeq 3.83171 \times 30 /[2 \pi(3+0.318 /$
$\sqrt{ } 2.55) \sqrt{ } 2.45]=3.654 \mathrm{GHz}$
Simulated Results:
Good impedance match at 3.63 GHz

|  |  |
| :--- | :--- |
| Mode | $\boldsymbol{K}_{\text {nm }}$ |
|  |  |
| $\mathrm{TM}_{11}$ | 1.84118 |
| $\mathrm{TM}_{21}$ | 3.05424 |
| $\mathrm{TM}_{02}$ | 3.83171 |
| $\mathrm{TM}_{12}$ | 5.33140 |

Used as N-way Power Divider with input at the center.

## Broadband CMSA - Metallic Plate in Air

# Broadband CMSA - Radiation Pattern 

Radiation Pattern at 2.45 GHz
$\mathrm{HPBW}_{\mathrm{E}}=58^{0}, \mathrm{HPBW}_{\mathrm{H}}=71^{0}$
Gain $=9.5 \mathrm{~dB}$ at 2.45 GHz
X-pol < 17 dB

## Semi-Circular MSA

For $a=3 \mathrm{~cm}, \varepsilon_{r}=1$, and $h=0.65 \mathrm{~cm}$, N-type Connector at $x=1.0 \mathrm{~cm}$
$\mathrm{BW}=2.525$ to $2.640 \mathrm{GHz}=115 \mathrm{MHz}(4.4 \%)$, Gain $=9.0 \mathrm{~dB}$
In comparison: CMSA of $a=3 \mathrm{~cm}$ and $x=1.1 \mathrm{~cm}$
$\mathrm{BW}=2.514$ to $2.699 \mathrm{GHz}=185 \mathrm{MHz}(7.1 \%)$, Gain $=9.5 \mathrm{~dB}$

## Equilateral Triangular MSA (ETMSA)

For Fundamental $T M_{10}$ Mode:

$$
f_{0}=\frac{2 c}{3 S_{e} \sqrt{\epsilon_{e}}}
$$

where $S_{e} \simeq S+4 h / \sqrt{ } \varepsilon_{r}$

## ETMSA Design - $T M_{10}$ Mode

₹ For $f_{0}=3 \mathrm{GHz}, \varepsilon_{r}=2.55, h=0.159 \mathrm{~cm}$ $S_{e} \simeq(2 \times 30 /(3 \times 3 \times \sqrt{ } 2.35)=4.35 \mathrm{~cm}$
$S=S_{e}-4 \times 0.159 / \sqrt{ } 2.55=3.95 \mathrm{~cm}$
Taken $S=4 \mathrm{~cm}, H=3.46 \mathrm{~cm}, y=1.52 \mathrm{~cm}$
$f_{0}=3 \mathrm{GHz}, \mathrm{BW}=40 \mathrm{MHz}$, Gain $=6.26 \mathrm{~dB}$

Current Distribution and Radiation Pattern at 3.0 GHz
